

Python Variables

Variables store data values. Python creates a variable when you assign a value using =.

Examples

```
x = 10
name = 'Arya'
price = 99.5
is_student = True
```

```
print(x)
print(name)
```

Rules

1. Start with a letter or underscore.
2. Cannot start with a number.
3. Case-sensitive (age and Age are different).
4. Avoid Python keywords.

Multiple Assignment

```
a, b, c = 1, 2, 3
x = y = z = 100
```
